3. Start your Mass Check

Countries

By default(when you leave this countries field empty) curation job will run automatically for ALL countries

Business Partner Lookup Configuration

Choose a configuration that will be used during lookup job. You can specify configuration in the app:

Business Partner Lookup Configurator

▶ Start Overlap Check

Callout annotations:

the user can see what is possible and what the status of the service is. by selecting the service, the available jobs are displayed, which the user can download either via JSON or as usual in the corresponding excel format.

Data Mirror first. Here the user is always seeing what is in my "configuration" for starting the job.

according to the screen resolution, the elements can be displayed side by side or one below the other.

Our focus should the the "JOB-Content" instead of the "Report". If the User is selecting the "Job", he can see the derived Reports like a accordion directly at the Job. The User should understand that a report always consists of the data from the JOB.

The final step is to trigger the job und select a configuration.
